

Large statistics study of QCD topological charge distribution

Presenter: Silvano Petrarca (Univ. of Rome "La Sapienza" and INFN)

L. Giusti, S. Petrarca, B. Taglienti

Abstract: We present preliminary results for the distribution of the topological charge in the $SU(3)$ Yang-Mills theory obtained by using the definition of the charge suggested by Neuberger fermions. We find statistical evidence for deviations from a gaussian distribution. The large statistics required has been obtained by using PCs of the INFN-GRID.
