

PROB

$$\begin{aligned} \text{A. } 3000 \text{ Cal} &= (3 \times 10^3 \text{ Cal}) (4.19 \times 10^3 \text{ J/Cal}) \\ &= 1.26 \times 10^7 \text{ J} \end{aligned}$$

ASSUME NONE OF THE WATER BOILS AWAY.
YOU MIGHT WONDER HOW YOU WOULD KNOW
SOME DOES.

$$1.26 \times 10^7 \text{ J} = M_{\text{H}_2\text{O}} C_{\text{H}_2\text{O}} (T_f - 37.0^\circ\text{C})$$

$$T_f = \frac{1.26 \times 10^7 \text{ J}}{(65 \text{ kg})(4.19 \times 10^3 \text{ J/kg}^\circ\text{C})} + 37.0^\circ\text{C}$$

$$= 46.2^\circ\text{C} + 37.0^\circ\text{C}$$

$$\boxed{T_f = 83.2^\circ\text{C}}$$

$$\begin{aligned} \text{B. } \# \text{ RACES} &= \frac{1 \text{ RACE}}{10 \text{ km}} \times \frac{1.61 \text{ km}}{100 \text{ Cal}} \times 3000 \text{ Cal} \\ &= 4.83 \rightarrow 5 \text{ RACES} \end{aligned}$$

$$\text{C. } 5000 \text{ Cal} = 5 \times 10^3 \text{ Cal} \times 4.19 \times 10^3 \text{ J/Cal} = 2.095 \times 10^7 \text{ J}$$

LET'S SEE IF WATER REACHES BP AT 100°C

$$Q(\text{REQUIRED}) = M_{\text{H}_2\text{O}} C_{\text{H}_2\text{O}} (100^\circ\text{C} - 37^\circ\text{C})$$

$$= (65 \text{ kg})(4.19 \times 10^3 \text{ J/kg}^\circ\text{C})(63^\circ\text{C}) = 1.716 \times 10^7 \text{ J}$$

WATER DOES GET TO BP AND THERE IS Q LEFT OVER
TO BOIL SOME OF IT AWAY

$$Q_{\text{LEFT}} = (2.095 - 1.716) \times 10^7 \text{ J} = 3.792 \times 10^6 \text{ J}$$

$$3.792 \times 10^6 \text{ J} = m'_{\text{H}_2\text{O}} L_v(\text{H}_2\text{O})$$

$$m_{\text{H}_2\text{O}} = \frac{3.792 \times 10^6 \text{ J}}{3.35 \times 10^6 \text{ J/kg}} = \boxed{1.13 \text{ kg}}$$

$$\boxed{T_f = 100^\circ\text{C}}$$
